

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Original) A method for the adhesion of windowpanes (1) using a frame (3) that exhibits sealing lips (2) comprising the steps:
  - contacting the windowpane (1) with sealing lip (2);
  - pressing in the adhesive (6) through at least one opening (4) in the frame into a hollow space (5) that is bounded by at least a sealing lip and a windowpane; and
  - hardening the adhesive (6).
2. (Previously Presented) The method according to claim 1, characterized in that the ends of the sealing lip (2) that face the front touch each other or are connected and form an enclosed annular or channel-shaped hollow space (5), into which adhesive (6) is pressed.
3. (Previously Presented) The method according to claim 1, characterized in that two sealing lips bound the hollow space (5).
4. (Previously Presented) The method according to claim 3, characterized in that the two sealing lips are connected with each other and represent an essentially U-shaped sealing profile (10).
5. (Previously Presented) The method according to claim 1, characterized in that the adhesive (6) is pressed into the hollow space (5) through at least 2 openings (4) in the frame.
6. (Previously Presented) The method according to claim 1, characterized in that in addition, at least one egress opening is present in the frame (3) or sealing lip (2).
7. (Previously Presented) The method according to claim 1, characterized in that the sealing

lip (2) is produced of an elastic material and is deformed by means of impinging pressure caused by the adhesive (6) that is pressed in, and presses itself onto the windowpane (1).

8. (Previously Presented) The method according to claim 1, characterized in that in the cross-section to the windowpane and to the adhesion, the single sealing lip, at least, exhibits the hollow space (5) in a concave form, which is bounded by at least one sealing lip and windowpane, in the area of the transition between the sealing lip (2) and the windowpane (1).

9. (Previously Presented) The method according to claim 1, characterized in that prior to the pressing in of the adhesive, the windowpane is pressed upon using means of applying pressure, or by the application of a vacuum.

10. (Previously Presented) The method according to claim 1, characterized in that the hollow space (5), which is bounded by at least a sealing lip and a windowpane, is essentially completely filled with adhesive (6).

11. (Currently Amended) The method according to claim 1, characterized in that the adhesive's setting time exhibits between 1 and 20 minutes, ~~especially between 1 and 10 minutes, preferably between 1 and 5 minutes.~~

12. (Previously Presented) The method according to claim 1, characterized in that the adhesive contains at least one (meth)acrylate.

13. (Previously Presented) The method according to claim 1, characterized in that the adhesive is filled and firm.

14. (Previously Presented) The method according to claim 1, characterized in that the frame is constructed essentially of wood or lacquered wood.

15. (Previously Presented) The method according to claim 1, characterized in that the windowpane is an insulating glass pane.
16. (Previously Presented) The method according to claim 1, characterized in that the one opening (4), at least, through which the adhesive (6) is pressed in, is configured so that it accommodates the egress end (11) of a static mixer 12 and is sealed off by the latter.
17. (Withdrawn) The method according to claim 16, characterized in that the one opening (4), at least, through which the adhesive is pressed, is so configured that it is produced by means of at least two concentric bore holes (13) of differing diameter.
18. (Withdrawn) An article characterized in that it is produced by means of the method according to claim 1.
19. (Withdrawn) The article according to claim 18, characterized in that the article is a window or a door, including a folding window or a folding door.
20. (Withdrawn) The article according to claim 18, characterized in that the opening through which the adhesive is pressed is arranged in the fitting groove (14) of the frame.
21. (Withdrawn) An adhesive for the purpose of producing an article according to claim 18, characterized in that the adhesive is a dual component (meth)acrylate adhesive.
22. (New) The method according to claim 1, characterized in that the adhesive's setting time exhibits between 1 and 5 minutes.
23. (New) A method for adhering a windowpane to a frame, comprising:  
contacting a windowpane to at least one sealing lip, wherein the sealing lip comprises an elastic material; and

pressing an adhesive through at least one opening in a frame into a hollow space that is bounded by the sealing lip and the windowpane, wherein the hollow space is filled with adhesive.
